

Cost effective system for ice throw detection

Najeem Lawal

Mid Sweden University

Node deployment

An investigation into visual monitoring system with the objective is to

- Capture deployment requirements
- Achieve cost optimized node deployment
- Investigate use of multiple cameras at a node
- Minimize power and communication requirements

At each node

Investigate:

- Multi-camera system
- Real-time segmentation of sky images for bird detection
- Spectral analysis of NIR images for ice detection
- Path / behaviour analysis
- Reconfigurable architecture for node implementation

Investigations: Deployment

System 1 is a monitoring system base on Intel PC and network storage.

- Capture and store images only. No processing

System 2 is also based on Intel PC. Only sequences of images with objects will be saved.

- Image processing for object detection.
- Less power (by ~180W)
- Lower cost (by ~ SEK 100,000) per node.

System 3 is based on reconfigurable hardware

- Capture, detect object and store/transmit information about flight paths.
- Assumes that reconfigurable platform will lower node cost and energy.

System 4 is based on multiple cameras and reconfigurable hardware

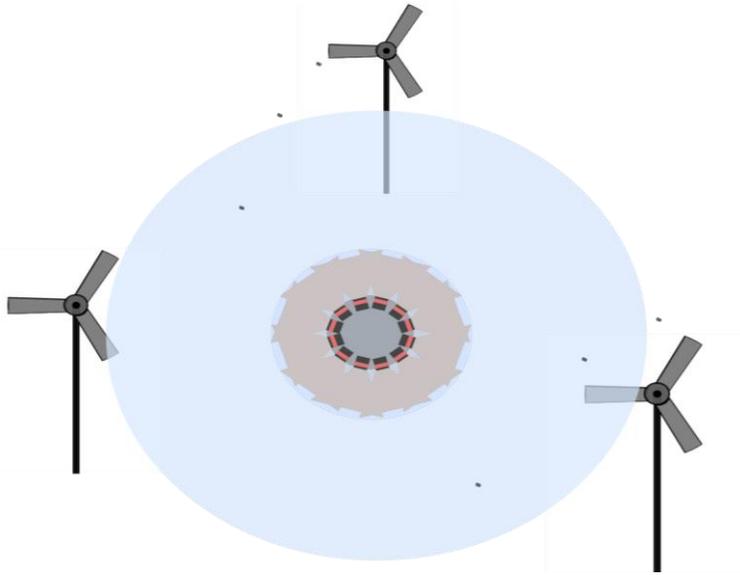

- A dome at each node. Benefits from shared resources.
- The cost and resource requirements/optimization require investigation.

Systems 1-3 use single camera per node with fixed FoV.

Cost minimization results

Monitoring System	Technology Requirement	Data Produced	Energy Requirements	Memory Requirements	Estimated Cost per node	# of Nodes
System 1	Software platform	Compressed images for 10hrs	4.5 kWh per day	720 gigabytes per day	SEK 150.000 per month	100
System 2	Software platform	Compressed ROI images	1kWh per day	~72 megabytes per day	SEK 50.000 per month	100
System 3	Configurable platform	Sizes, species, positions and age	50 Wh per day	<1 kilobytes per day	SEK 15.000 one-time-cost	100
System 4	Configurable platform	Sizes, species, positions and age	<u>Requires investigation</u>	<1 Kilobytes per day	<u>Requires investigation</u>	<u>5</u>

Summary

- An on-going project
- Analyses sensor specifications, processing and coverage requirements
- Aims to cover large area, (wind par rather than single turbine)
- Aims to minimise the cost of monitoring the area for ice and bird detection.

Partners

This project is in collaboration with:

- Combitech
- Vattenfall
- InSitu Instruments
